SUMMARY

EA W800X-50AILW is a color active matrix thin film transistor (TFT) liquid crystal display (LCD) that uses amorphous silicon TFT as a switching device. It's an IPS technology which provides an extreme wide viewing angle all around. There's no more color shift or inversion effect. Together with the bright backlight it is definitely readable und all light conditions including direct sunlight.

This TFT LCD has a 5.0 inch diagonally measured active display area with 800x480 (800 horizontal by 480 vertical pixel) resolution.

A black metal frame enables easy mounting direct to pcb or any other base board with 1.6mm thickness.

Fig. 8.1. Definition of viewing angle

Note 2: Test equipment setup:

After stabilizing and leaving the panel alone at a driven temperature for 10 minutes, the measurement should be executed. Measurement should be executed in a stable, windless, and dark room. Optical specifications are measured by Topcon BM-7or BM-5 luminance meter 1.0° field of view at a distance of 50cm and normal direction.

Fig. 8.2. Optical measurement system setup

Note 3: Definition of Response time:

The response time is defined as the LCD optical switching time interval between "White" state and "Black" state. Rise time, T_r , is the time between photo detector output intensity changed from 90% to 10%. And fall time, T_f , is the time between photo detector output intensity changed from 10% to 90%

Note 4: Definition of contrast ratio:

The contrast ratio is defined as the following expression.

$$\text{Contrast ratio (CR)} = \frac{\text{Luminance measured when LCD on the "White" state}}{\text{Luminance measured when LCD on the "Black" state}}$$

Note 5: Definition of Luminance Uniformity

Active area is divided into 9 measuring areas (reference the picture in below). Every measuring point is placed at the center of each measuring area.

$$\text{Luminance Uniformity (U)} = \text{Lmin/Lmax} \times 100\%$$

L = Active area length

W = Active area width

Note 7: Measured at the center area of the panel when all the input terminals of LCD panel are electrically opened.

CONTOUR DRAWING

CAPACITIVE TOUCH

The EA TOUCH800-50C1 is a Projected Capacitive Touchpanel (PCAP). With its resolution of 800x480 it matches perfectly to the display incl. mounting frame EA W800X-50AILW.

Surface is glass with 6H hardness incl. anti-finger-print coating.

There's a controller FT5346 integrated that provides an I²C bus interface (address 0x70/0x71). It is good for up to 5 finger action and provides direct coordinates.

Outside of viewing area is a black cover printing. On the rear side is a double side adhesive glue for mounting abilities to display frame or frontal plate. It's preferred to use outer adhesive for front plate only and fixing the display by metal frame.

RESISTIVE TOUCH

The EA TOUCH800-50R1 is a 4 wire resistive touch panel. It has a selfadhesive material on its rear side that makes it simply to stuck onto the display frame. The connection is made by means of a 4-pin flexible cable for a ZIF connector (e.g. EA WF100-04S) with a grid of 1.0 mm. Bending radius is defined with min. 5mm. Interfacing to a μ C can be either done via external touch panel controller or directly with a μ C that is featured with analogue inputs. How to work with it ? The touch panel is similar to a potentiometer: connecting a voltage of e.g. 3.3V to the pins Top-Bottom makes it possible to read out a voltage on pin Left or Right which is linear to the Y-coordinate of the pressed point. The Xcoordinate will result when the voltage will be supplied to Left-Right and measurement is done at Top or Bottom. The pinout of the connecting cable is shown in the drawing.
